

SentinelFlow & Akamai Integration Guide

Complete Point-Wise Problem Solving & Troubleshooting Manual
Target System: `siem.abppplus.com` | Source: `akamai-abppplus`

1. Root Cause Summary (Asli Problem Kya Thi?)

Live server audit aur test logs run karne ke baad 2 mukhya kaaran mile:

Component	Root Cause (Samasya)	Impact & Status
Akamai Gzip Compression	Akamai DataStream 2 by-default logs ko Gzip Compress karke bhejta hai. Live server par gzip decompression code deploy nahi tha.	400 Bad Request: Server compressed bytes ko invalid JSON samajhkar reject kar raha tha.
API Key Outdated / Mismatched	Source 26-August ko bana tha. Plaintext key expire/lost ho gayi thi.	Resolved: Nayi verified key generate kar di gayi hai jo direct test me 200 OK pass hui.
Fortinet Firewall Interception	Office/College network par FortiGate firewall <code>siem.abppplus.com</code> ko 'Newly Observed Domain' bolkar block karta hai.	Network Block: Browser me red SSL warning aur connection closed error aata hai.

2. Akamai Control Center Settings (Point-Wise Solution)

Akamai Control Center me jakar DataStream 2 me ye 6 settings verify aur update karein:

Point 2.1 — Compression: Turn OFF (Sabse Zaroori)

- **Action:** Destination settings me **Compression** ko **None / Off (Do not gzip)** select karein.
- **Kyun:** Server uncompressed JSON ko 100% successfully accept karta hai. Gzip on hone se server 400 error de deta hai.

Point 2.2 — Destination URL Format

- **Action:** Endpoint URL me exact per-source path dalein:
`https://siem.abppplus.com/api/integrations/akamai/akamai-abppplus/logs`
- **Dhyan dein:** Generic URL (jaise sirf `siem.abppplus.com` ya `/api/v1/ingest`) na dalein.

Point 2.3 — Custom Authentication Header

- **Authentication Type:** None chunein.
- **Custom Request Header Name:** X-Ingest-Key
- **Header Value (Live Verified Key):**
`sfk_p0mzD6leYSOdnL9TatMWkwWEEMBRokkoYpZZOnjQUI8`

Point 2.4 — Data Format & Method

- **Method:** POST
- **Format:** JSON ya Structured JSON (W3C ya Apache combined na chunein).
- **Content-Type:** `application/json`

Point 2.5 — Stream Activation (Production vs Staging)

- **Action:** Stream ko **Activate on Production** karein.
- **Propagation Time:** Akamai global edge servers par config failane me **15 se 45 minute** lagata hai.

Point 2.6 — Property Association

- `DataStream` configuration ke andar apni live website ki **Property (CDN hostname)** select honi chahiye. Agar property link nahi hogi to Akamai 0 logs capture karega.

3. Verification Test (cURL Se Test Karein)

Akamai ke bina bhi aap apne terminal se turant check kar sakte hain ki `SentinelFlow` logs accept kar raha hai:

```
curl -i -X POST "https://siem.abpplus.com/api/integrations/akamai/akamai-abpplus/logs" \
-H "X-Ingest-Key: sfk_p0mzD6IeYS0dnL9TatMWkwWEEMBRokkoYpZZ0njQUl8" \
-H "Content-Type: application/json" \
-d '[{
  "type": "akamai_siem",
  "reqTimeSec": "1788854400",
  "cliIP": "203.0.113.195",
  "httpMessage": {
    "reqMethod": "GET",
    "reqPath": "/articles/news-today",
    "statusCode": "200",
    "reqHost": "abpplus.com"
  },
  "geo": {"country": "IN"}
}]'
```

Expected Output: HTTP/1.1 200 OK | {"ingested":1,"alerts":0,"source":"akamai-abpplus"}

4. SentinelFlow Server Fix (Gzip Support Enable Karna)

Agar aap chahte hain ki Akamai se **Gzip Compression ON** hone par bhi SentinelFlow logs reject na kare, to local branch *rohit* me jo gzip decompression code likha hai use server par deploy karein:

File: backend/akamai_ingest.py me ye change hai:

```
import gzip
import json

def parse_akamai_payload(raw: bytes) -> List[Dict[str, Any]]:
    if not raw:
        raise ValueError("empty Akamai payload")

    # Auto-detect and decompress gzip payloads from Akamai
    if raw.startswith(b"\x1f\x8b"):
        try:
            raw = gzip.decompress(raw)
        except Exception as exc:
            raise ValueError(f"failed to decompress gzip: {exc}")

    text = raw.decode("utf-8", errors="replace").strip()
    ...
```

Server par deploy karne ke steps:

1. Local code commit karein: `git add backend/akamai_ingest.py && git commit -m 'Support gzip Akamai logs'`
2. GitHub par push karein: `git push origin rohit`
3. Production server (34.131.111.51) par git pull karke FastAPI restart karein.

5. Fortinet Firewall Block Ko Solve Karna

Aapke computer par *siem.abppplus.com* kholne par jo error aata hai, wo office/institute ke **FortiGate Firewall** ki wajah se hai.

Option A: Mobile Hotspot (Turant Kaam Karega)

- Apne computer ko Mobile Hotspot (4G/5G) se connect karein. Mobile par koi Fortinet firewall nahi hota, isliye website seedha bina warning ke khulegi.

Option B: FortiGuard Re-evaluation Request

- FortiGuard Web Filter portal par request daalein:
<https://globalurl.fortinet.net/rate/submit.php>
- Domain **siem.abppplus.com** daalkar category **Information Technology** select karein. 24h me globally unblock ho jayega.

Option C: Cloudflare Proxy (Best Permanent Solution)

- Apne DNS manager me *siem.abppplus.com* ka **Cloudflare Proxy (Orange Cloud)** enable karein. Isse enterprise firewalls ise newly observed domain samajh kar block nahi karenge.

6. Quick Configuration Cheat Sheet

Parameter	Correct Value to Set
Destination Type	Custom HTTPS
Endpoint URL	https://siem.abppplus.com/api/integrations/akamai/akamai-abppplus/logs
HTTP Method	POST
Authentication	None
Custom Header Name	X-Ingest-Key
Custom Header Value	sfk_p0mzD6IeYSOdnL9TatMWkwWEEMBRokkoYpZZOnjQUI8
Compression	None / Off (Do not gzip)
Format / Content-Type	JSON / application/json
Admin Login (UI)	admin@sentinelflow.io / Admin@12345
Local Ingest URL	http://localhost:8000/api/v1/ingest
